# Lab 8 Report

# Nakkina Vinay (B21AI023)

# **Question 1**

Installing all the necessary libraries

#### Subpart 1:

- Getting the dataset and using the head() to print it
- Getting the information of the dataset using info()

```
<class 'pandas.core.frame.DataFrame'>
  RangeIndex: 103904 entries, 0 to 103903
 Data columns (total 25 columns):
      # Column
                                                                                                                                                                                                                             Non-Null Count Dtype
    0 Unnamed: 0
1 id
                                                                                                                                                                                                                      103904 non-null int64
103904 non-null int64
      1
      2 Gender
                                                                                                                                                                                                                   103904 non-null object

      2
      Gender
      103904 non-null object

      3
      Customer Type
      103904 non-null object

      4
      Age
      103904 non-null int64

      5
      Type of Travel
      103904 non-null object

      6
      Class
      103904 non-null int64

      7
      Flight Distance
      103904 non-null int64

      8
      Inflight wifi service
      103904 non-null int64

                        Departure/Arrival time convenient 103904 non-null int64
    10 Ease of Online booking 103904 non-null int64
11 Gate location 103904 non-null int64
| 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 non-null int64 | 103904 | 103904 non-null int64 | 103904 non-null int64 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 103904 | 1039
  dtypes: float64(1), int64(19), object(5)
  memory usage: 19.8+ MB
```

- Dropping the unnecessary columns like 'Unnamed: 0'
- Encoding the categorical variables using Label Encoding
- Replacing any '-' values with Nan and converting all columns to float and imputing the missing values with mean
- Splitting the dataset into X and Y variables

```
X_que1 = dataset1.drop('satisfaction', axis=1)
y que1 = dataset1['satisfaction']
```

#### Subpart 2:

- Using the train\_test\_split() function the dataset was split into training and testing sets
- Created an object of SFS by embedding the Decision Tree classifier object,
   providing 10 features, forward as True, floating as False, and scoring = accuracy.
- Train SFS on the dataset and printed the best features

#### Best Features:

```
('Customer Type', 'Type of Travel', 'Class', 'Inflight wifi service', 'Ease of Online booking', 'Gate location', 'Online boarding', 'Baggage handling', 'Checkin service', 'Inflight service')
```

 Calculated accuracy using a DecisionTreeClassifier for the obtained 10 best features and all the features

```
Accuracy on best 10 features selected from sfs is : 94.7392129733904% Accuracy on using all features is : 94.56546220920879%
```

## Subpart 3:

- Using the forward and Floating parameter toggle between SFS(forward True, floating False), SBS (forward False, floating False), SFFS (forward True, floating True), SBFS (forward False, floating True), and choosing cross-validation = 4 for each configuration.
- o Printed the cv scores for each configuration.

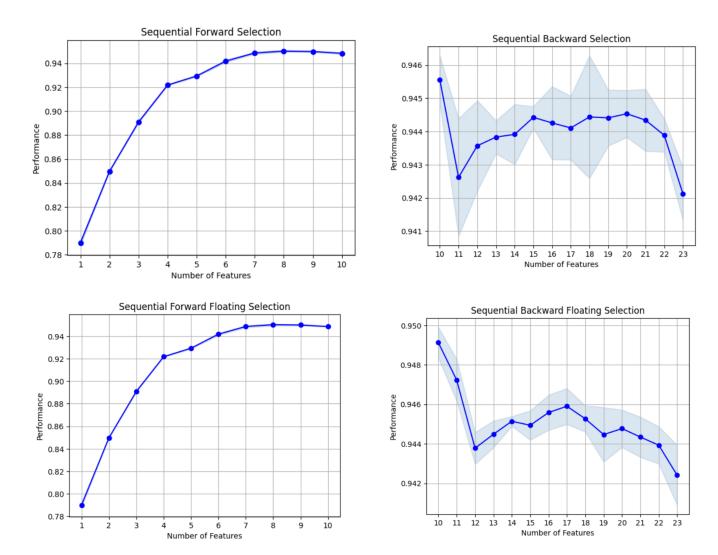

```
CV score for configuration SFS is: 0.9483417326423065
CV score for configuration SBS is: 0.9455560963762351
CV score for configuration SFFS is: 0.9486037415025601
CV score for configuration SBFS is: 0.9491277569409522
```

## Subpart 4:

 Visualising the output from the feature selection in a pandas DataFrame format using the get\_metric\_dict for all four configurations.

	feature_idx	cv_scores	avg_score	feature_names	ci_bound	std_dev	std_err
SFS	[2, 4, 5, 7, 9, 10, 12, 17, 18, 19]	[0.9485906558552595,0.9486458160957582,0.947	0.948342	[2, 4, 5, 7, 9, 10, 12, 17, 18, 19]	0.001238	0.000772	0.000446
SBS	[2, 4, 5, 7, 10, 13, 14, 17, 18, 19]	[0.9443433173368636, 0.9462739257543162, 0.945	0.945556	[2, 4, 5, 7, 10, 13, 14, 17, 18, 19]	0.001167	0.000728	0.000420
SFFS	[2, 4, 5, 7, 9, 10, 12, 17, 18, 19]	[0.9489216172982514, 0.9488112968172541, 0.947	0.948604	[2, 4, 5, 7, 9, 10, 12, 17, 18, 19]	0.000781	0.000487	0.000281
SBFS	[2, 4, 5, 7, 10, 12, 13, 14, 17, 19]	[0.9488112968172541, 0.9504661040322135, 0.948	0.949128	[2, 4, 5, 7, 10, 12, 13, 14, 17, 19]	0.001265	0.000789	0.000455

o Finally, plotting the results for each configuration

## Subpart 5 and 6:

- Bidirectional feature-set generational algorithm from scratch
- Using the selection criteria from the following:
  - Accuracy Measures: using Decision Tree and SVM Classifiers
  - Information Measures: Information gain
  - Distance Measure: Angular Separation, Euclidian Distance and City-Block Distance
  - Distance Measures. Measures of separability, discrimination, or divergence measures. The most typical is derived from the distance between the class conditional density functions.)

 Selected features from accuracy measure and information measure selection criteria are

Selected features (accuracy measure): ['id', 'Customer Type', 'Type of Travel', 'Class', 'Inflight wifi service', 'Departure/Arrival time convenient', 'Ease of Online booking', 'Gate location', 'Food and drink', 'Online boarding', 'Seat comfort', 'Inflight entertainment', 'On-board service', 'Baggage handling', 'Checkin service', 'Inflight service', 'Cleanliness', 'Arrival Delay in Minutes', 'Gender', 'Age', 'Leg room service', 'Flight Distance', 'Departure Delay in Minutes']

Selected features (information measure): ['id', 'Flight Distance', 'Gender', 'Customer Type', 'Age', 'Type of Travel', 'Class', 'Inflight wifi service', 'Departure/Arrival time convenient', 'Ease of Online booking', 'Gate location', 'Food and drink', 'Online boarding', 'Seat comfort', 'Inflight entertainment', 'On-board service', 'Leg room service', 'Baggage handling', 'Checkin service', 'Inflight service', 'Cleanliness', 'Departure Delay in Minutes', 'Arrival Delay in Minutes']

## **Subpart 7:**

 Training DecisionTreeClassifier on the Selected features generated from each measure and calculating its accuracy

Accuracy using Decision Tree and Random Forest: 0.961938909191202

Accuracy using Information Gain and Random Forest: 0.962297455698821

# **Question 2**

# **Subpart 1:**

 Generating a dataset of 1000 points from a zero-centered Gaussian distribution with a covariance matrix

$$\sum = \begin{bmatrix} 0.6006771 & 0.14889879 & 0.244939 \\ 0.14889879 & 0.58982531 & 0.24154981 \\ 0.244939 & 0.24154981 & 0.48778655 \end{bmatrix}$$

Labelling the points as shown below

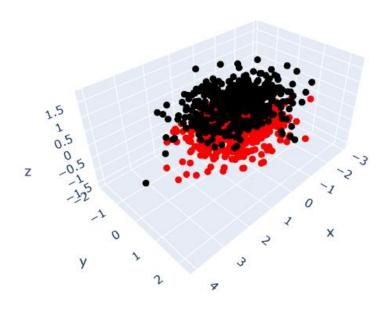

$$class = \begin{cases} 0 & \overrightarrow{x}.\overrightarrow{v} > 0 \\ 1 & \overrightarrow{x}.\overrightarrow{v} <= 0 \end{cases} where \overrightarrow{v} = \begin{bmatrix} 1/sqrt(6) \\ 1/sqrt(6) \\ -2/sqrt(6) \end{bmatrix}$$

- o Creating s 3D scatter plot using Plotly's scatter3d function
- Resulting visualisation shows two distinct regions corresponding to the two labels

# Subpart 2:

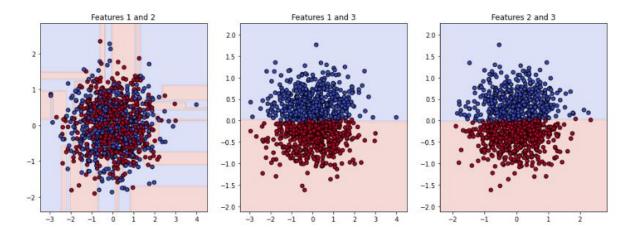

- Applying Principal component analysis with n\_components=3 on the input data and transforming the data accordingly
- o Plotting the 3D plot for the transformed data

• Resulting visualisation shows how the data has been transformed into a new coordinate system that captures the most important variation in the data

## **Subpart 3:**

- Performing complete feature selection on the transformed data with a number of features in subset equal to two.
- Fit a Decision Tree for every subset-set of features of size 2 and plot their decision boundaries superimposed with the data.

#### **Subpart 4:**

- Selecting the subset of features obtained by applying PCA with n\_components=2 and fit a decision tree
- Calculating the accuracy of this decision tree
- Now fitting a decision tree for every subset of features of size 2 and calculating their accuracies and plotting a bar graph of their accuracies

PCA Features: Accuracy = 0.4900
Features 1 and 2: Accuracy = 0.4750
Features 1 and 3: Accuracy = 0.9700
Features 2 and 3: Accuracy = 0.9800
